

AegisRAG Test Document - Page 1

This is the first page of the document. AegisRAG is a Corrective RAG system.

It implements Hybrid Search, Re-Ranking, and Asynchronous Ingestion.

PostgreSQL stores document metadata and vector indices are kept in Qdrant Vector DB.

This is the second page. Celery processes these files in the background using Redis. The ingestion pipeline splits the text, generates embeddings, and indexes them. FastEmbed runs ONNX-optimized embeddings locally on CPU.
